Primary finding

No_Tumor 54.8% confidence (low)

The model's primary read is **no tumour** with 54.8% probability - no lesion was detected in the analysed slice(s). Low-confidence prediction. The imaging evidence is ambiguous - recommend a dedicated MRI protocol and specialist review before any management decision.

Confidence spectrum

Class	Probability	Confidence
Glioma	35.91 %	????????????????????????
Meningioma	4.83 %	????????????????????????
No_Tumor	54.78 %	????????????????????????
Pituitary	4.48 %	????????????????????????

Test-time augmentation: enabled (7 views averaged)

Suggested clinical pathway (decision support)

• No tumour-directed therapy indicated from this examination.

• Correlate clinically; incidental findings or subtle non-enhancing pathology may require dedicated sequences (e.g., FLAIR, DWI).

• Follow up only if clinically warranted.

Note: A 'no tumour' read applies to the slices analysed - it does not exclude pathology outside the imaged volume.

Disclaimer. This is an AI decision-support system for research and educational use. It is NOT a certified medical device. Results are imaging-based inferences only; definitive diagnosis and WHO grading require histopathology, molecular testing and review by a qualified clinician.
